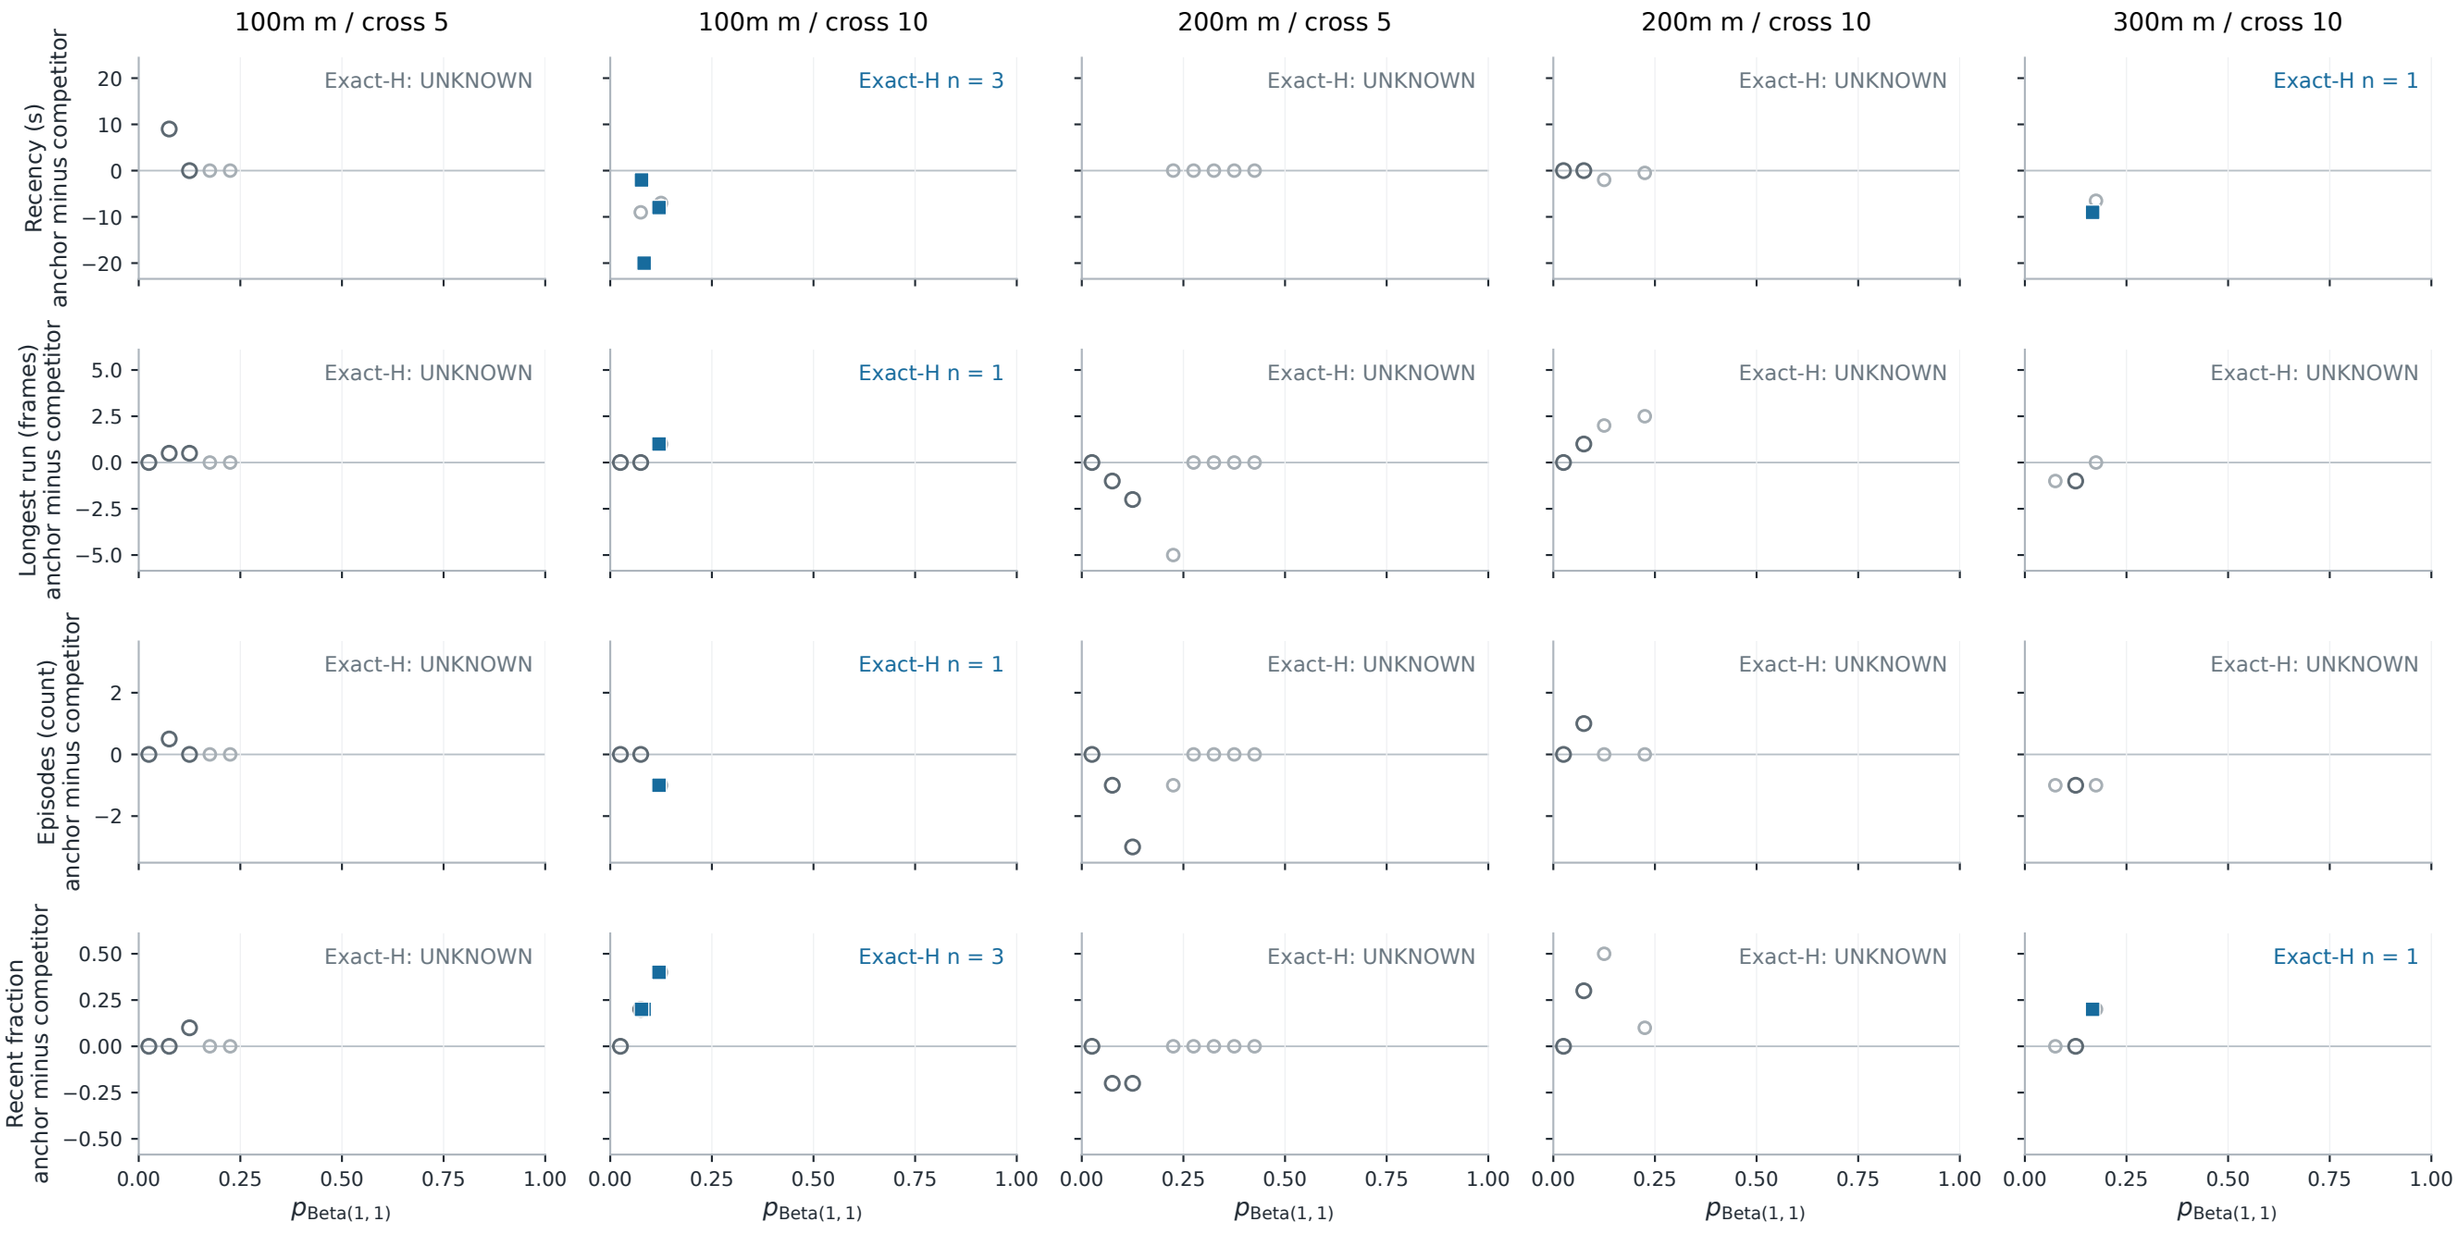
Frequency-bin contrasts change when exposure and cell identity are controlled

Nearest observed-anchor nodes versus the existing background-only winner; no path rescoring or score changes



All plotted histories have F >= 5. Small pale circles have fewer than 3 finite observations in at least one population.

Exact pairs retain H >= 1 for recency / recent and require H >= 2 for run / episodes; same-cell ties are excluded.

Missing p-bin support is blank, not zero. Recent fraction uses 5 prior frames (approximately 5 s at recorded cadence, not a 5 s time window).

Observed anchors are selected DEV_SILVER; distinct cells do not certify object identity or independent samples.
